

Beta release

[www.aquaticresources.org/enhancefish.html](http://www.aquaticresources.org/enhancefish.html)

## Known problems and bugs

Beta testing of the ***EnhanceFish*** software has identified the following minor problems, which we will fix for the first 'definitive' version. None of these problems affect the core functionality of the software. We encourage you to participate in testing of the Beta version and work around these small problems where necessary. We expect to release the first 'definitive' version of the software and documentation in late May or June, and will notify all registered users when this happens.

Known problems and remedies:

- Loading of data files. The data files do not always load fully until at least one of the parameter setup sheets has been opened. **Remedy:** Simply open one of the setup sheets after loading the data file.
- The effort costs in the Sole file have been set to 198,000,000 US\$ rather than the 260,000,000 US\$ assumed in the example analysis. **Remedy:** Simply change this value in the economics setup sheet and save the data file.
- There are occasional problems with the display of 3D graphs when two controls are simulated. Some graphs may be displayed in 2D only, and not all axis labels may be shown. **Remedy:** Export the data into other packages such Excel for 3D plotting, or simulate a series of 2D graphs for different levels of the second control.
